

Why dogs and water shouldn't mix

Flea treatments are becoming a serious problem for aquatic animals and invertebrates. The liquid flea treatments we apply to our dogs' neck can wash off in a pond, lake, river or sea and kill invertebrates that live in the water which effects the whole ecosystem.

We recommend using tablets as the treatment remains internal. Or only treating when absolutely needed.

Dog-xploring: keep their paws on the paths

You might be surprised to learn that there are great benefits to sticking to the paths when you are out with your dog. If all dogs and their owners used the same paths this means lots of doggy smells are left behind which is enriching for your dog to learn who else has been in the area. We check our smart phones for emails, why not let your dog check their pee-mails?

Entrances to paths are often the prime locations for information signs so you will see the most up to date information about visiting the area.

Dogs experience nature very differently to us especially through smell, but this can get them into trouble if they encounter wildlife along the way such as snakes or ground nesting birds whom they can disturb, when walking with your dog try to imagine the area from their perspective!
